Symptom-Triggered Alcohol Detoxification in C&V UHB Hospitals - Guideline

Introduction and Aim
This document sets out the usual way to conduct an alcohol detoxification in an inpatient setting through the UHB.

Objectives
- To standardise the practice of alcohol detoxification in hospital settings – in line with NICE CG100

Scope
This guideline applies to the usual management of alcohol detoxification in all Cardiff and Vale UHB inpatient settings. Rationale for divergence from this guideline should be documented in patient records.

Equality Impact Assessment
An Equality Impact Assessment has not been completed. (please delete as necessary) Where it has not been completed indicate why e.g. ‘This is because a procedure has been written to support the implementation the …………… Policy. The Equality Impact Assessment completed for the policy found here to be a negative/positive/no impact.

Symptom-Triggered Alcohol Detoxification

Introduction

This method of detoxification is an alternative to fixed-dose treatment strategy and should be used only when training has been completed by nursing and medical staff. It is of potential benefit as the duration of detoxification is reduced although there is a requirement for more monitoring of withdrawal symptoms (NICE, 2010)

With this method patients with overt or suspected alcohol withdrawal are objectively assessed for presence of significant withdrawal at regular intervals. Severity of withdrawal is assessed using a standardized scale – The CIWA-Ar (Sullivan et al, 1989).

If found to have significant alcohol withdrawal, the patient is given a stat dose of diazepam 20mg. This procedure of standardised assessment and treatment is repeated every ninety minutes until the patient is no longer in withdrawal and detoxification is complete

Inclusion Criteria

Alcohol-dependent adult patients requiring treatment of withdrawal

Patients with a history of previous alcohol-withdrawal seizures or delirium tremens

Exclusion Criteria

Patients with severe liver impairment or other major physical illness. Medical assessment must be sought prior to initiation of CIWA-Ar in cases of severe liver impairment as metabolism of diazepam and its metabolites maybe dramatically slowed

When to initiate the scale

The patient reports alcohol withdrawal symptoms or shows signs of alcohol withdrawal

The patient’s history indicates a likelihood of withdrawal reaction:

1. drinking large amounts of alcohol over a long period of time
2. history of withdrawal symptoms
3. last drink within the past 12 hours.

If such a history is not evident, observe informally for signs of withdrawal as people may deny dependent drinking.

How to use the CIWA-Ar scale

The prescribing practitioner should prescribe diazepam 20mg to be given for CIWA-Ar scores of 11 or more. All other sedative hypnotics already prescribed for the patient should continue to be prescribed at the same doses and times, on a regular basis in the “regular medication” section of the prescription sheet.

Take the scale with you when assessing the patient. Ask each question as it appears on the CIWA-Ar and assign a score to each item. Speak slowly and clearly and reword
questions, if necessary.

Adjust the score based on the subjective and objective signs and symptoms. Add up the number of points and assign a total score.

Take the vital signs. These are not factored into the overall scoring but they provide important clinical information. Slight elevation of these signs is common. Please record Vital Signs and Neurological Observations separately every 90 minutes.

Medical review at 200mg or every 24 hours should be noted on the ‘as required’ section of the prescription sheet.

What to do next

If CIWA-Ar score is 11 or over administer give diazepam 20mg po stat

If the CIWA-Ar score is under 11 do not administer medication.

After 90 minutes, reassess symptoms of withdrawal, using the CIWA-Ar again. If CIWA-Ar score is 11 or over administer diazepam 20mg po stat.

Repeat the process every 90 minutes until CIWA-Ar score is under 11 on 3 consecutive occasions. At this point formal detoxification is complete and CIWA-Ar assessments may be stopped.

Continue then to monitor informally including monitoring vital signs and neurological observations to ensure there is no re-emergence of symptoms.

If the patient is asleep (usually at night) at the time of their scheduled CIWA-Ar then the CIWA-Ar should be suspended and their respiratory rate should be checked and noted. The patient should be returned to every 90 minutes and their respiratory rate rechecked and noted. On waking, the CIWA-Ar should resume until three consecutive CIWA-Ar scores have fallen below 11.

What to expect generally

Expect that a large minority of patients will not require diazepam at all as CIWA-Ar score will be under 11 from the outset. Expect a median duration of detoxification of 8 hours.

What if CIWA-Ar score remains above 11 after 24 hours?

Some patients may remain symptomatic despite prolonged (i.e. >24 hours) CIWA-Ar monitoring and Benzodiazepine treatment. In such cases, the diagnosis of Alcohol Withdrawal should be medically reviewed. Look for other causes (i.e. benzodiazepine dependence, drug seeking behaviour, organic agitation as part of delirium or other cause). Discontinue detoxification, consider other drug treatment strategies and if necessary investigate further.

Seizures

Alcohol is a common cause of epileptic seizures. Well managed alcohol detoxification reduces, but does not completely prevent alcohol withdrawal seizures. Episodes are usually
experienced as a single tonic clonic seizure. Management is as per NICE CG137, the
guidance describing when active treatment is required. Secondary prevention of further
seizures (risk between 13-24%) is recommended: give diazepam 20mg orally and restart or
continue CIWA-ar scored alcohol withdrawal detoxification procedure.

Remember Pabrinex

Wernicke-Korsakoff Syndrome (WKS) is a neurological syndrome of Vitamin B deficiency
that may have serious sequelae.

Prophalaxis against Wernicke-Korsakoff Syndrome should be given to all alcohol
dependant patients as follows: Pabrinex (Ampoules I & II) I.V. twice daily for 3 days.
Pabrinex should be diluted in 100ml saline infused over 30 minutes.

In patients with signs of possible WKS, (i.e. acute delirium, ataxia, gaze palsy), give 2 pairs
of Pabrinex (Ampoules I & II) I.V. three times daily and continue for as long as symptoms
are improving.

When to refer for assistance?

If symptoms continue for longer than 24 hours please refer for medical review.

For repeat attendees please refer to Substance Misuse Liaison Nursing Team.

For those wanting assistance with changing drinking behaviours please refer to Substance
Misuse Liaison Nursing Team

The Substance Misuse Nursing Team covers only the acute settings in Llandough and
University Hospital. Advice in mental health settings can be sought from Adfer Ward –
Whitchurch Hospital (see useful contacts) or through E-DAS for potential community
treatment referrals.

Discharge

Ideally any patient commencing a symptom triggered alcohol detoxification as an inpatient
should be allowed to complete it (adjudged to be three consecutive CIWA-Ar scores under
11).

If discharging a patient part way through an alcohol detoxification, the rationale for
discharge should be explained in the patient record.

Training

Please approach your ward manager / clinical lead to arrange CIWA-Ar training and ensure
that you update training annually.

Appendix 3
Symptom Triggered Alcohol Detoxification

ON ADMISSION:
The following information may indicate likelihood of alcohol withdrawal reaction:
1. drinking large amounts of alcohol over a long period of time
2. past history of withdrawal symptoms
3. last drink within the past 12 hours.
If withdrawal expected prescribe as follows:

Write "diazepam 20mg for CIWA-Ar scores of 11 or more" on PRN side of chart

oral thiamine 100mg tds

Signs of WKS?

NO

YES

Pabrinex: 2 pairs of amps tds as long as improvement continues
(IM or slow IV infusion over 30 mins)

Pabrinex: 1 pair of amps bd (IM or slow IV infusion over 30 mins) for three days

Maintain on oral thiamine 100mg tds and include on TTH

STOP detox & consider referral to SM liaison team*

More than 200mg diazepam given and / or still scoring after 24 hours?

Medical review:
1. Decision to continue or suspend CIWA detox
2. If continuing specify next medical review
3. If complex detox consider SM liaison input?

Seizures in Alcohol detoxification
Usually experienced as a single tonic clonic seizure.
Manage prolonged seizure or status epilepticus as per NICE CG137
Post seizure, administer single dose of diazepam 20mg (as shown in flowchart) and continue / restart CIWA-ar scoring.

* Substance Misuse (SM) liaison contacts
For:
Mental health patients: – contact Pinwydd 24830
Patients in other areas: – contact 44901

Acronyms:
CIWA-Ar – Clinical Institute Withdrawal Assessment – Alcohol Revised
WKS – Wernicke Korsakoff’s Syndrome
(T/TH = to take home (discharge medication)
IM = Intramuscular IV = Intravenous
